The Studies on the Comparative Anatomy, Histology and Physiology of the Alimentary System of Certain Common Littoral Fishes

Excerpt from Comparative Anatomy of Vertebrates: With Three Hundred and Seventy-Figures and a Bibliography The developmental history of this book has been somewhat complicated. The first German edition appeared in 1882, under the title of Lehrbuch der vergleichende Anatomie der Wirbeltiere, and a second edition followed in 1886. In 1884, a short Grundrisse was published, which, after passing through four editions and gradually increasing in size, replaced the Lehrbuch under the title of Vergleichende Anatomie der Wirbeltiere, in 1902. A farther edition appeared in 1906, and this was followed by a shorter Einführung in 1907: the latter was written to meet the requirements of beginners, and it contains no bibliography. The first and second English editions (1886 and 1897) were based respectively on the first and third editions of the Grundriss, and considerable modifications in detail were introduced. The present (third) edition, which has been almost entirely re-written, was prepared from the German editions of 1906 and 1907, and I am much indebted to Professor Wiedersheim for allowing me to make such alterations as seemed desirable in the interests of English students, and for the pleasure of his collaboration last summer, when I had the advantage of discussing various points with him personally. The general plan of the original has been retained throughout, but I found it advisable to extend some portions and to abridge others, besides making various minor

Excerpt from Syllabus of the Lectures on Physiology and Histology: Including the Outlines of Comparative Anatomy. Delivered at the University of Virginia An acquaintance, to a certain extent, with natural history, must precede the study of natural philosophy, since we must collect, verify, and classify facts, before we can interpret or explain them. In natural history we do not go beyond the Observation and classification of phenomena. In philosophy we begin with natural history, (collection of facts.) and regarding phenomena as effects, aim to explain them by the discovery of causes and laws. Veterinary Anatomy, Histology, Physiology and Comparative Anatomy

Comparative Anatomy and Histology: A Mouse, Rat, and Human Atlas, Second Edition is aimed at the new mouse investigator as well as medical and veterinary pathologists who need to expand their knowledge base into comparative anatomy and histology. It guides the reader through normal mouse anatomy and histology using direct comparison to the human. The side by side comparison of mouse and human tissues highlight the unique biology of the mouse, which has great impact on the validation of mouse models of human disease. This second edition features added comprehensive tables of mouse background strains and lesions for quick comparison with normal anatomy. New imaging modalities (MRI, CT, microCT, Pet/CT, Bioluminescence) have been incorporated into every body system chapter. Offers the only comprehensive source for comparing human and mouse anatomy and histology through over 600 full-color images, in one reference work Enables human and veterinary pathologists to examine tissue samples with greater accuracy and confidence Teaches biomedical researchers to examine the histologic changes in their mutant mice Includes input from experts from both human and veterinary fields Takes readers through each organ system in a side-by-side comparative approach to anatomy and histology-human Netter anatomy images along with Netter-style mouse images Includes virtual microscope slides of both human and mouse histology from each body system

The Comparative Anatomy and Histology of the Cerebellum was first published in 1970. Minnesota Archive Editions uses digital technology to make long-unavailable books once again accessible, and are published unaltered from the original University of Minnesota Press editions. This is the second volume of the late Dr. Larsell's comprehensive monograph on the cerebellum, the first volume of which is described below. A third volume, on the human cerebellum, will be published by the University of Minnesota Press next spring to complete the work. This second volume deals with the morphogenetic development and morphology of the cerebellum of all orders of mammals from monotremes through apes. The descriptions cover the cerebellum in about forty species with special emphasis on the cerebellum of the albino rat, rabbit, cat, and rhesus monkey. Dr. Larsell's comparative anatomical studies over a period of many years led to the conclusion that fundamentally the mammalian cerebellum is composed of ten subdivisions. With few exceptions (the smallest and most primitive cerebella) the subdivisions are identified in all mammals. The descriptions of the cerebella are based on the author's personal investigations but the relevant literature is thoroughly reviewed also.

Comparative Anatomy and Histology of the Mammalian Oviduct
Excerpt from Text-Book of Comparative Anatomy, Vol. 1 The morphology of the animal body, which is the subject of the following excellent text-book, has been, during the last forty years, i.e. since the commencement of my academic career, the favourite object of my scientific labours. During these four decades no other science has undergone such profound and striking transformation. In the years 1852-1856, when I attended in Berlin and Würzburg the masterly anatomical and zoological lectures of Johannes Müller, Albert Kolliker, and Franz Leydig, the study of comparative anatomy and of comparative histology had been brought into great prominence through Müller's classical researches in the former, and Leydig's in the latter field. Oscar Schmidt's text-book of comparative anatomy which resulted from the transcription of Johannes Müller's summer lectures, and passed through eight editions, gives evidence of the stage then reached by that science. Upon this work the present text-book of Professor Arnold Lang is founded, as its ninth edition; the present state and needs of the science, however, compelled the new editor to rewrite the whole book on a much larger scale. Johannes Müller, the great master in the domains of comparative anatomy and physiology, died in 1858, after having held sway as the leader in these sciences for more than quarter of a century. This very year 1858 saw the simultaneous publication by Charles Darwin and Alfred Wallace of their preliminary sketches of the Theory of Selection. The year after appeared the Origin of Species, which at one stroke ushered in, by means of this theory, a new epoch for the biological sciences.
